Instagram User Analytics

Trainity Project Report

Rohit Kumar
rohitk.ug20.ce@nitp.ac.in

Description

This report analyses how consumers engage and interact with our digital platform (software or mobile application) to gain marketing and investor metrics business insights. Teams from throughout the company can utilize these insights to start a new marketing campaign, choose which features to include in an app, gauge the app's success by looking at user engagement, and generally improve the user experience while supporting the expansion of the company.

Approach

This report will be divided up primarily into two sections.

1) Marketing

I. **Rewarding Most Loyal Users** - To find most loyal users – for rewarding purpose (Top 5 oldest users of the Instagram)

II. **Remind Inactive Users to Start Posting** – Sending mail to those users who have never posted single photo yet

III. **Declaring Contest Winner** -To find details of Winner(user) of contest who gets most likes on single photo

IV. **Hashtag Researching** - To find top 5 Hashtag- for better reach to the most people

V. **Launch AD Campaign** - To find the day on which users register more Instagram

Approach

2) Investor Metrics

I. User Engagement - Are users still active on Instagram or not?

- To find this I will check

  a) how many times does average user posts on Instagram?

  b) Total number of photos on Instagram/total number of users.

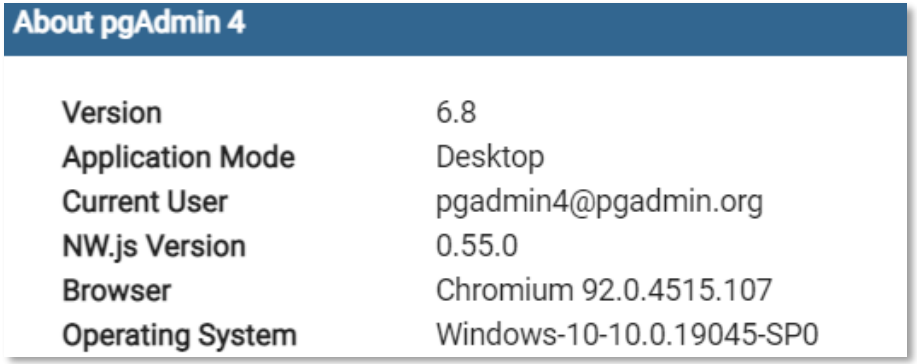
II. Bots & Fake Accounts - Are there any fake/dummy accounts are active on Instagram?

- To find this I will check

  a) Data on users (bots) who have liked every single photo on the site (since any normal user would not be able to do this).

Tech-Stack Used

- For this Project I used **PostgreSQL PG Admin 4 version 6.8**



- This project is based on the provided “IG_clone” dataset which I modified due to syntax error.
  [IG_Clone DataSet]

ANALYSIS
&
RESULT

1 (I) Rewarding Most Loyal Users

- Top 5 oldest users of the Instagram are here below

1. Darby_Herzog
2. Emilio_Bernier52
3. Elenor88
4. Nicole71
5. Jordyn.Jacobson2

Query:-

```
SELECT username , created_at
FROM users
ORDER BY created_at ASC
LIMIT 5;
```

16°C Sunny ENG 01:27 10-01-2023

Insights

- It took 7 days to get our first 5 users from getting our first user
- There are around 26 % user (including fake accounts) are not posted any single content yet
- There is no direct relation between posting content and getting likes (as there are some users have posted around 12 images but they not getting winning likes) “**users like Quality over Quantity**”
- Most commonly used hashtags are indicating free fun enjoying activities of users, (we can assume that people like to post their images of enjoyment)
- It is strange to that most people register on Instagram are on working days. Though Saturday weekend day still it had less no of user registration.
- There are 13 fake account who gave likes on each post of Instagram, while this account never posted any content yet.

Results & Conclusions

- This project was very helpful to understand and strengthen key concept of SQL

- It was helpful toward practicing of basic to intermediate SQL Quarries, and it was fun to write them, getting stuck and resolve error.

THANK YOU !
